

VELUSE AGENCY STANDARD OPERATING PROCEDURE (SOP)
DEPARTMENT: Paid Acquisition
SUBJECT: The Meta Ads Architecture & Scaling Protocols
PURPOSE: To provide Veluse Agency media buyers and strategists with the definitive blueprint for deploying, testing, and scaling Meta (Facebook/Instagram) advertising campaigns for our Med Spa clients. We do not rely on luck; we rely on algorithmic compliance, relentless creative volume, and strict financial thresholds.

PART 1: META ADS STRATEGY & THE UGC LOOP

Meta ads are disruption-based, meaning prospects are scrolling for entertainment, not actively searching for a solution like they do on Google 1, 2. Because of this lower immediate intent, Meta will supply an ocean of leads, but the conversion rate will naturally be lower (typically 2% to 5% for high-ticket Med Spa packages) 1, 3.

To optimize this traffic, we must deploy the following architectural strategies:

- **The UGC Double-Dip:** The most efficient way to source winning ads is to look at organic content. We take the highest-performing short-form organic videos (User Generated Content or founder videos) and append a 5-second Call to Action (CTA) to the end, then run them as paid ads 4-6.
- **Friction as a Filter:** Because Meta brings high volume, we must protect our clients' sales teams (and our AI booking bots) from low-quality tire-kickers. We add strict qualification questions, application steps, and even upfront deposits to increase friction, forcing the extra, unqualified volume to self-select out 3, 7, 8.
- **Feed the Machine (The Andromeda Protocol):** Meta's current ad algorithm functions by consuming massive amounts of creative to find a tiny percentage of winners. If you feed the machine 100 ads, it will only pick the top 10% that perform well and funnel spend there 9. We must constantly feed the algorithm fresh creative to avoid audience fatigue and maintain scale 9, 10.

PART 2: THE "MAGIC" HEADLINE FORMULA

Eighty cents of every advertising dollar is spent the moment you write your headline 11-13. If the prospect does not stop scrolling, the rest of the funnel is useless. We use the **M-A-G-I-C** headline framework to guarantee attention and clearly define the offer:

- **M - Magnetic "Reason Why":** Give them a logical reason for the promotion. Think like a fraternity party planner—invent a reason (e.g., "Holiday Hangover," "Spring Reset") 14.
- **A - Avatar (Who):** Call out the exact ideal prospect and hyper-local area (e.g., "Attention Scottsdale Moms") 15.
- **G - Goal (Dream Outcome):** State the ultimate transformation they desire 14.
- **I - Interval (Timeline):** The specific timeframe for the result 14.
- **C - Container (Method):** The vehicle delivering the result (e.g., Challenge, Blueprint, Intensive) 14, 16.

The Simplified Execution Formula: When media buyers need to write rapid-fire variations, condense the MAGIC formula into three mandatory parts: **Duration + Benefit + Power Word** 17-19.

- *Execution Example:* "28-Day Duration Drop Two Dress Sizes Benefit Accelerator Power Word" 18, 19. Once an offer works, we never change the core offer; we simply change the "wrapper" (the headline and reason why) to combat ad fatigue 20-23.

PART 3: TESTING VS. SCALING CAMPAIGNS

We divide our ad budgets into distinct phases: testing to find winners (losing money intentionally) and scaling to maximize profit 24-26.

Phase 1: The Testing Campaign (The "Lose Money" Phase) When launching new creatives or hooks, you must be prepared to lose money to acquire data. However, we cap our downside using strict mathematical rules.

- **The 80/20 Testing Rule:** 80% of our creative effort and budget goes toward tried-and-true, proven hooks. Only 20% of our ad variations should be entirely new, experimental ideas 27-29.
- **The "2x 30-Day Cash" Kill Switch:** To determine how long to let a new ad run before shutting it off, budget exactly *two times* the cash you collect from a new customer in their first 30 days 25, 26, 30, 31. For example, if a Med Spa nets \$100 in profit from a new patient in the first 30 days, we let the test ad spend up to \$200. If it generates leads within that window, we optimize it. If it hits \$100 (1x 30-day cash) and generates zero leads, we kill it instantly 25, 26.

Phase 2: The Scaling Campaign (The "Print Money" Phase) Once a testing campaign yields an ad that breaks even or achieves our target Lifetime Gross Profit to Customer Acquisition Cost (LTGP:CAC) ratio, we transition to scaling.

- **Reverse-Engineered Budgets:** At the scaling phase, we do not ask "how much should we spend?" We ask "how many customers can fulfillment handle?" 26. If the Med Spa can handle 100 new patients this month, and our CAC is \$100, our base budget is \$10,000.
- **The Scale Pad:** Because ad efficiency inevitably degrades as you scale into colder, broader audiences 26, 32, 33, we pad the required budget by 20%. To acquire those 100 patients, we set the budget at \$12,000 26, 34.

PART 4: BUDGET INCREASES & THE LEARNING PHASE

Scaling a campaign requires managing Meta's algorithmic "Learning Phase." When an ad account is pushing massive volume (e.g., moving from \$5,000 to \$10,000 a day), campaigns can break or get stuck in the learning phase, destroying efficiency 35, 36.

Exiting the Learning Phase: If you are running high daily spends and your campaign refuses to exit the learning phase, the issue is often creative bloat. The algorithm is attempting to test too many assets with the allocated budget.

- **The Fix:** You must artificially constrain the machine. Cut the number of active creatives down to a maximum of 25 to 50 per campaign 37. By consolidating the budget into fewer creatives, the algorithm can rapidly acquire the necessary conversion events to exit the learning phase and stabilize 37.

Operational Note on Volatility: What often masquerades as ad volatility is simply a symptom of low volume 38, 39. Do not obsess over daily fluctuations. Track the 30-day conversion cycle, force the campaigns out of the learning phase by limiting active creatives, and rely on the UGC loop to constantly refresh the top of the funnel 37, 39, 40.
