

VELUSE AGENCY STANDARD OPERATING PROCEDURE (SOP) DEPARTMENT:

Revenue Architecture & Conversion Rate Optimization (CRO) **SUBJECT:** The Landing Page & CRO Protocol

PURPOSE: To establish Veluse Agency's militant standards for engineering high-converting landing pages. Traffic is completely useless if we cannot convert it into cash flow. This SOP dictates the exact architecture for optimizing the "Above the Fold" real estate, deploying the mandatory 3 landing page tests, and ruthlessly eliminating friction to drive down our Med Spa clients' Customer Acquisition Cost (CAC).

PART 1: OPTIMIZING THE "ABOVE THE FOLD" REAL ESTATE

For our Med Spa AI-infrastructure and marketing campaigns, the most expensive and critical real estate on any landing page is "above the fold"—everything the prospect sees on their desktop or mobile screen *before* they scroll 1. If we do not sell them on staying and reading further in this exact space, we lose the lead 1.

The "Above the Fold" Veluse Checklist:

- **Remove the Logo/Brand Name:** If we are driving cold traffic, the prospect does not know or care who the Med Spa is 2, 3. Remove the logo from the top so it does not push the critical sales copy down the screen 2.
- **The Magic Headline:** The headline must provide a very clear, immediate reason for the prospect to move forward 2, 3.
- **The Sub-Headline (The Objection Killer):** Directly beneath the headline, insert a sub-headline that clarifies the context or eliminates the prospect's biggest immediate concern about the headline's promise 2, 4.
- **The 3-Bullet Stack:** Underneath the sub-headline, list exactly three punchy bullets that state the core benefits of the offer 5, 6.
- **The Image/Video:** Include a highly relevant image or Video Sales Letter (VSL) right next to or under the headline to visually anchor the offer 1, 7.

PART 2: THE 3 LANDING PAGE TESTS TO SKYROCKET CONVERSIONS

Amateur agencies try to test 100 different variables on a page at once, resulting in zero usable data 8. At Veluse Agency, we mandate a cadence of executing exactly *one* split test per week per funnel 8, 9.

Because almost all of the conversion juice happens above the fold, 90% of our split tests must focus on these three specific variables 1:

1. **Test #1: The Headline:** This is the absolute highest-leverage test. We simply change the core promise or the "wrapper" at the top of the page while keeping the entire rest of the funnel identical 1, 8. In one of Alex Hormozi's portfolio companies, simply changing the headline on the landing page increased the call booking rate by 62% 10.
2. **Test #2: The Image Under the Headline:** If the headline is dialed in, the next test is the visual creative immediately underneath it 1. We swap the main image or the VSL thumbnail to see which visual creates a stronger anchor for the prospect 1.
3. **Test #3: The Sub-Headline / Lead-In:** We test the secondary text that bridges the gap between the headline and the Call to Action (CTA) 11.

PART 3: EXACT PLACEMENT OF SUB-HEADLINES & CTAs

The Sub-Headline Architecture: The sub-headline serves a highly specific psychological purpose: it must address the prospect's biggest objection to the headline 12. If our headline is "Launch an Elite High-Profit Med Spa," the sub-headline must mitigate their immediate fear by stating "...without having to redesign your existing location or buy expensive equipment" 12, 13. You can also use the sub-headline to explicitly call out the target avatar (e.g., "Attention: Med Spa Owners Doing \$1M+ ARR") 6.

The CTA (Call To Action) Placement: A confused mind does not buy, and it certainly does not click 14, 15.

- **The Command:** The CTA must be blindingly clear. Do not be clever; spell it out exactly (e.g., "Click this button," "Go to this website") 16.
- **The Placement:** The primary CTA button must be placed *above the fold*, immediately following the sub-headline or the 3-bullet stack 6.
- **The Top Banner:** We must also utilize a banner locked across the very top of the page with a CTA button. This is historically one of the most clicked buttons on any landing page 17. Having two or three CTA buttons early on the page gives the prospect multiple convenient opportunities to convert, directly increasing the overall conversion rate 17, 18.

PART 4: REMOVING FRICTION TO ANNIHILATE CAC

The fundamental mathematical rule of Customer Acquisition Cost (CAC) is this: Every single step, click, or form field you force a prospect to complete is a "drop-off point" where you will lose leads 19, 20.

If you force a prospect to jump through 30 unnecessary hoops, you might capture a perfectly qualified customer, but you will lose 90% of the people who *would* have bought if you had just made it easier 21.

The Economics of Form Fields & Friction:

- **Bad Friction:** Slow page load times and unnecessary form fields are "bad friction." They cause both highly qualified and terrible leads to bounce 22-24. For every 1 second of page load time saved, conversion rates increase by roughly 2.5% 24.
- **The Form Field Drop-off:** The more information you request, the more friction you create 25. Asking for a cell phone number or income bracket creates significantly more friction than just asking for a first name and email 25. A simple 1-step email opt-in will mathematically generate vastly more leads than a 5-step form 19.
- **How Removing Friction Lowers CAC:** If we spend \$1,000 on ads and drive 100 clicks to a Med Spa landing page that has 8 unnecessary form fields, we might get 5 opt-ins (a 5% conversion rate). That equals a \$200 Cost Per Lead (CPL). If we eliminate the bad friction, simplify the page to a 1-step opt-in, and boost the conversion rate to 20%, that same \$1,000 ad spend now yields 20 leads. Our CPL instantly plummets from \$200 to \$50 20, 26.

By obsessively optimizing the above-the-fold real estate and ruthlessly deleting unnecessary form fields, Veluse Agency multiplies our clients' lead flow without spending a single extra dollar on advertising, thereby drastically lowering CAC and generating massive profit margins.
